//note="Vector: Bluescript SK-; Site_1: EcoRI; Site_2: XhoI

//note="Vector: Bluescript SK-; Site_1: EcoRI; May Synthesized from poly mRNA using containing a small percentage of host or bacterial containing a XhoI site. Following second strand synthesis, EcoRI adapters were ligated to the cDNA and products were size-selected on Sephacryl S500. cDNAs were digested with EcoRI/XhoI and cloned into lambda Zap II (Stratagene). Clones were converted to phagemids by mass excision using ExAssist helper phage and SOLR cells (Stratagene). Insert sizes range from 0.7-1.5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8.00

Coll Dates

Rice is the most important food crop in the world. Half of
the world population, especially those inhabiting highly
populated areas of the humid tropics and subtropics, rely
on rice as their primary source of carbohydrate.
Monocotyledonous rice is a diploid plant (2n=24) with a
haploid genome equivalent of 431 Mbp (Arumuganathan and
Earle, 1991). The relatively small genome of rice, three
times larger than that of Arabidopsis, makes it suitable
for genomic studies. In order to facilitate positional
cloning, physical mapping and genome sequencing of rice,
we have constructed a HAC library from Oryza sativa,
Nipponbare variety using EcoRI as the cloning enzyme. The
library contains 55,296 clones with an average insert size
of 121 Kb providing approximatley 15 haploid genome
equivalents. The deep coverage allows the isolation a
particular sequence with a probability of 99.9 %. Three
high density filters, each containing 18,432 clones
(doubly spotted), represent the whole library for colony
screening and can be requested from the Clemson University
BAC/EST Resource Center (www.genome.clemson.edu)."

                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                  Score

It is structurally related to the protein avidin. It can be readily conjugated to a range of other proteins. In order to facilitate the incorporated of streptavidin into expression vectors and the production of novel chimeric proteins containing streptavidin functionality, an improved novel synthetic gene for streptavidin has been constructed (n90755) based on the amino acid sequence of mature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This sequence represents a streptavidin which is used in a novel method CC of reducing interference from non-specific binding in assays. Mutelins CC constructed from a core streptavidin or avidin sequence are selected that CC differ from the native polypeptide by at least one amino acid and have a CC binding affinity for biotin of less than 1010 1/mole. The biotin-bindable CC polypeptide may be present as a polymeric conjugate, e.g. with another CC polypeptide or protein, especially bovine serum albumin. These muteins CC are used as anti-interference reagents for reducing and/or avoiding CC nonspecific interactions in a process for detecting an analyte. In particular, they are used in assays where the streptavidin/avidin-biotin CC determination of an analyte of a quantitative and/or quantitative concession or a hybridisation assay. Despite having a lower binding CC affinity for biotin, the muteins have high immunological cross-reactivity with native streptavidin and avidin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes a wild-type streptavidin protein isolated from Streptomyces avidini. This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or determine.

The FCE can be used in a method for producing fibrin. Fibrin is useful as a sealant in surgery to, e.g. reduce bleeding by sealing blood vessels, and tissues that have been dissected either in surgery or through wounding. The fusion protein allows for the removal of the fibrinogen converting enzyme from the fibrin sealant preparation via the binding of streptavidin to a biotin solid support. The present sequence represents Streptococcus streptavidin as given in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is streptavidin, a plant-noxious protein. Recombinant vector, pART27 expressing a chimeric polypeptide comprising streptavidin mature peptide fused to the potato proteinase inhibitor-II (PDI-II) signal peptide is targetted to the vacuole.

Transformation of plant genome with the vector can produce pest resistance in plants, plant derived products and stored harvest material. Pests that can be controlled include, cotton bollworm, tropical army-worm, European corn-borer or red mite, tobacco horn worm, loopers, rice stem borer, porina, cutworms, diamondback moth, potato tuber moth, codling moth, Indian meal moth, gypsy moth, argentine stem weevil, clover root weevil, grass-grubs, corn rootworm, rice and wheat weevils, mealworms, flour beetles, black field cricket, locusts, sawfiles, Western flower thrips, Hessian flies or two-spotted mite.

This sequence represents the Streptomyces avidinii sps protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used

This sequence represents the Streptomyces avidinii mst protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.

Streptavidin may be expressed from a fusion gene comprising its coding gene and encoding a target protein of interes, where he streptavidin has binding sites for biotin or deriv. The streptavidin has 4 binding sites free for biotin, and is produced free of biotin contamination. Improved streptavidins may also be produced by site-directed mutagenesis. The fused gene may be used to produce labelled, chemically-modified proteins in vivo, and to isolate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        biotin and also have another function, for e.g. binding to a cell through the secondary functional domain comprising a cell adhesion peptide. The streptavidin molecules are useful as adaptors to bring, via a streptavidin/biotin interaction, the secondary functional domain into proximity with a cell or molecule to be affected and as a coating for substrates such as vascular devices or prostheses. Therefore, any compound of interest, such as a nucleic acid, protein, peptide, organic compound, inorganic compound, polysaccharide or a combination, can be targeted, delivered or immobilized using them. The molecules, when comprising an antibody for its secondary functional domain, are also useful in diagnostic applications for detecting analytes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a wildtype streptavidin monomer. The specification describes streptavidin molecules comprising a biotin binding domain and a secondary functional domain. The molecules are adaptors with inherent effector function. They can therefore, bind to adaptors with inherent effector function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mutant streptavidin molecule, useful as an adaptor and a coating for substrates such as vascular devices or prostheses, comprises a biotin binding domain and a secondary functional domain -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a mutant streptavidin protein isolated from CC Streptomyces avidinii where the residues ESAV at position 44-47 of the mature wild type sequence are replaced by VTAR. This sequence is CC used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within CC the amino acid (aa) region 44-53 of the wild-type protein show a higher CC the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y CC and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant CC streptavidin mutants can be used to isolate, purify and determine CC proteins or to determine/recover substances that contain CC streptavidin-binding groups. Such compounds may also be used to CC immobilise fusions on microtitre plates, microbeads or sensor chips. NOTE: This sequence does not appear in the specification but has the value of t
                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                      affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips. NOTE: This sequence does not appear in the specification but has been constructed from the wild-type streptavidin sequence represented in V24714.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a mutant streptavidin protein isolated from Streptomyces avidinii where the residues ESAV at position 44-47 of the mature wild type sequence are replaced by IGAR. This sequence is used to produce mutants which are used in a method to assay the binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В
                                                             for substrates such as vascular devices or prostheses. Therefore, any compound of interest, such as a nucleic acid, protein, peptide, organic compound, inorganic compound, polysaccharide or a combination, can be targeted, delivered or immobilized using them. The molecules, when comprising an antibody for its secondary functional domain, are also useful in diagnostic applications for detecting analytes.
                                                                                                                                                                                                                                                              adaptors with inherent effector function. They can therefore, bind to biotin and also have another function, for e.g. binding to a cell through the secondary functional domain comprising a cell adhesion peptide. The streptavidin molecules are useful as adaptors to bring, via a streptavidin/biotin interaction, the secondary functional domain into proximity with a cell or molecule to be affected and as a coating

The present sequence represents a fusion of osteopontin and construction. It is a streptavidin molecule of the invention. The specification describes streptavidin molecules comprising a biotin compound; and describes streptavidin molecules comprising a biotin compound; with inherent effector functional domain. The molecules are damptors with inherent effector function, for e.g. binding to a cell compound; the secondary functional domain comprising a cell adhesion peptide. The streptavidin molecules are useful as adaptors to bring, compound; a streptavidin/biotin interaction, the secondary functional domain comprising a cell adhesion compound; a streptavidin/biotin interaction, the secondary functional domain compound; incorporates such as vascular devices or prostheses. Therefore, any compound, incorporate compound, polysaccharide or a combination, can be targeted, delivered or immobilized using them. The molecules, when compound, an antibody for its secondary functional domain, are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mutant streptavidin molecule, useful as an adaptor and a coating for substrates such as vascular devices or prostheses, comprises a biotin binding domain and a secondary functional domain -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Streptavidin; monomer; biotin binding domain; functional domain; biotin; cell adhesion peptide; adaptor; streptavidin/biotin interaction; substrate; vascular device; prosthesis; osteopontin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 38; 43pp; English.

                                                                                                                                                                                                                     The present invention describes a fibrinogen-converting enzyme fusion correction (FCE). The fusion protein is a multidomain protein comprising: (a) a FCE; and (b) a first member of a binding pair, that is linked to the FCE chain: (i) directly by bonds utilizing the N-terminal amino correct constant in the creation of the FCE chain (ii) directly by bonds utilizing the N-terminal amino correct constant interest proups or side-chain functionalities; (c) (ii) via a bifunctional linkage molety linking the groups or correct constant interest produced in the binding pair, where the second member of the binding pair where the second member of the binding pair is covalently attached to the first polypeptide chain. The FCE can be cused in a method for producing fibrin. Fibrin is useful as a sealant in surgery to, e.g. reduce bleeding by sealing blood vessels, and tissues considered the fibrin sealant in the fibrinogen converting converting enzyme from the fibrin sealant preparation via the binding of streptayddin to a biotin solid support. The present sequence encodes

```
Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of fruit -
```

Examples; Page 84; 91pp; English

The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidini sps gene as an example of the heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.

                                     This DNA sequence encodes a streptavidin which is used in a novel method of reducing interference from non-specific binding in assays. Muteins constructed from a core streptavidin or avidin sequence are selected that differ from the native polypeptide by at least one amino acid and have a binding affinity for biotin of less than 1010 1/mole. The biotin-bindable polypeptide may be present as a polymeric conjugate, e.g. with another polypeptide or protein, especially bovine serum albumin. These muteins are used as anti-interference reagents for reducing and/or avoiding nonspecific interactions in a process for detecting an analyte. In particular, they are used in assays where the streptavidin/avidin-biotin specific binding pair is involved for qualitative and/or quantitative determination of an analyte in a test sample, e.g. a heterogeneous affinity for blotin, the muteins have high immunological cross-reactivity with patricular and suriding
                                                                                                                                                                                                                                                           Disclosure; Page 16-17; 26pp; German.
                                                                                                                                                                                                                                                                                                     Streptavidin and avidin muteins with reduced binding affinity for blotin - useful for reducing interference from nonspecific binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-APR-1996;

                                                                                                                                                                                                                                                                                                                                                                                  Percent Similarity: 100.000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes a wild-type streptavidin protein isolated from Streptomyces avidinii. This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or
